### **DETAILED ACTION**

### General Status

1. Claims 1-10 and 21-30 are pending and are being examined.

# Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claims 1, 2, 4, 6, 7, 8, and 9 are rejected under 35 U.S.C. 103(a) as being obvious over U.S. Patent Number 4,814,735 to Williamson.

Regarding claims 1, 2, and 9, Williamson discloses windings for magnetic core devices comprising:

- (1) A ferrite core having upper and lower E core halves, (Figure 13)
- (2) Two interleaved helical coils (relative to upper and lower E core halves), such that when the core halves are mated and secured together, the coils are compressed. (Inherently springable and biased) (Column 6, lines 30-33)
- (3) Tab leads (terminal) of the coil positioned to fit printed circuit board receiving slots. (Figure 13) (Column 2, lines 4-7)

Williamson discloses the claimed invention except for stating that the springable winding is "biased to unwind..." However, it has been held that a recitation with respect to the manner in which a claimed structure is to be employed or used does not differentiate the claimed

Art Unit: 2832

apparatus/structure from a prior art apparatus/structure satisfying the claimed structural limitations. Ex parte Masham, 2 USPQ2d 1647 (1987). However, Williamson does state that the tab (85) or termination of the coil is "uncoiled". This is seen in figure 6 and stated in column 4, lines 15-23.

Regarding claim 4, it is clearly illustrated in Figure 13 that the magnetic core has an integrally formed base, which is a mount for the legs of the E shaped core.

Regarding claims 6 and 7, Williamson states the windings are formed of flat conductor strips with an insulation coating. (No encapsulation) (Abstract) (Column 2, lines 26-27)

Regarding claim 8 the magnetic device as claimed by Williamson is applicable to various fields employing magnetic core inductor or transformers. (Column 1, lines 5-8)

4. Claims 3, 5, and 10 are rejected under 35 U.S.C. 103(a) as being obvious over U.S. Patent Number 4,814,735 to Williamson.

Regarding claim 3, Williamson discloses the claimed invention including the helically would winding capable of being compressed (inherent that it would have a spring constant), except for the specific range of 750 to 2000 grams/inch. It would have been obvious to one having ordinary skill in the art, at the time the invention was made to incorporate a favorable range for a spring constant, since it has been held that where the general conditions of a claim are disclosed in the prior art, discovering the optimum or workable ranges involves only routine skill in the art. In re Aller, 105 USPQ 233.

Regarding claim 5, Williamson discloses the claimed in ferrite core except for the ferromagnetic material having a composition selected from a group consisting of Cobalt-Iron, Manganese-Zinc, Nickel-Iron, and amorphous Nickel-Phosphide. It would have been obvious to

Art Unit: 2832

one having ordinary skill in the art at the time the invention was made to incorporate a suitable ferrous material, since it has been held to be within the general skill of a worker in the art to select a known material on the basis of its suitability for the intended use as a matter of obvious design choice. *In re Leshin, 125 USPQ 415*.

Regarding claim 10, Williamson states that the insulated flat metal ribbon comprising the winding has a width greater than the thickness (aspect ration as defined by applicant: width to height), however he does not disclose the precise aspect ratio 1.6:1. It would have been obvious to one having ordinary skill in the art, at the time the invention was made, to find a suitable/workable aspect ratio, since it has been held that discovering an optimum value of a result effective variable involves only routine skill in the art. In re Boesch, 617 F.2d 272, 205 USPQ 215 (CCPA)

5. Claims 21-23 and 25-30 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent Number 4,814,735 to Williamson in view of Japanese Patent Number JP 56012714 A to Takasaki.

Regarding claims 21, 22, 27, Williamson discloses windings for magnetic core devices comprising:

- (1) A ferrite core having upper and lower E core halves, (figure 13);
- (2) Two interleaved helical coils (relative to upper and lower E core halves), such that when the core halves are mated and secured together, the coils are compressed (inherently springable; column 6, lines 30-33);
- (3) Tab leads (terminal) of the coil positioned to fit printed circuit board receiving slots (figure 13; column 2, lines 4-7).

Williamson discloses the claimed invention except for the convex portion of the core half.

Art Unit: 2832

Takasaki discloses a transformer having a core comprising convex portions on the part of the bottom portion of the core in order to prevent the separation at a junction of a base plate and the core.

One skilled in the art, at the time the invention was made would have found it obvious to combine the teachings of Williamson with the teachings of Takasaki and incorporate convex portions on the lower part of the core half in order for the core to stand separately or to facilitate attachment to another portion.

Williamson in view of Takasaki discloses the claimed invention except for stating that the springable winding is biased "to unwind to cause..." However, it has been held that a recitation with respect to the manner in which a claimed structure is to be employed or used does not differentiate the claimed apparatus/structure from a prior art apparatus/structure satisfying the claimed structural limitations. Exparte Masham, 2 USPQ2d 1647 (1987)

Regarding claim 23, Williamson further illustrates in Figure 13 that the magnetic core has an integrally formed base, which is a mount for the legs of the E shaped core.

Regarding claim 24, Williamson further illustrates in figure 1 that there is a concave portion located on an upper surface of the core halves.

Regarding claims 25, 26, 29, and 30 Williamson further illustrates in figure 13 that the magnetic core halves have outer legs and inner legs, wherein the 2 windings are placed about the center leg.

Regarding claims 28, Williamson states the windings are formed of flat conductor strips with an insulation coating (no encapsulation) (abstract) (column 2, lines 26-27).

## Response to Arguments

6. Applicant's arguments filed July 23, 2004 have been fully considered but they are not persuasive.

Regarding applicant's arguments, relating to claims 1, 2, 4, and 6-9, that the Williamson reference does not disclose, "baising to unwind", Examiner respectfully disagrees. Although the coils of the Williamson reference are compressed, the tab (85) or termination of the coil is "uncoiled". This is seen in figure 6 and stated in column 4, lines 15-23. As applicant agrees, as stated on page 7 of "Remarks/Arguments", "unwind" is defined as "to cause to uncoil, unroll". Furthermore, applicant's claimed claim 1, states, "...unwind said terminus" not the entire core. Therefore, the Williamson reads on claim one as he states that the tab is uncoiled.

Regarding applicant's arguments relating to claims 21-23 and 25-30, that Williamson discloses the claimed invention except for the convex portion of the core half, however does not teach the "biasing to unwind" limitation, as recited above, Examiner believes that Williamson does in fact disclose the "uncoiling" of the end tab of the coil.

## **Contact Information**

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jennifer A. Poker whose telephone number is 571-272-1997. The examiner can normally be reached on 4:30-3:00 Monday-Thursday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Elvin G. Enad can be reached on 571-272-1990. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
